2024	12	Japanese Language Proficiency Test (JLPT) N3 - Passed

Motivation for applying, special skills, favorite subjects, and personal strengths (self-promotion points), etc.

I aim to build a career in the IT field and am currently working on developing my skills as a full-stack engineer. I am interested in both backend technologies (Python/Django, Node.js) and frontend development (HTML, CSS, JavaScript, React), and I find it particularly appealing to understand and develop the entire system flow.

I am especially strong at logically organizing problems, analyzing their causes, and deriving effective solutions. Leveraging this strength, I have been studying practical skills such as API development, database design (MySQL, PostgreSQL, MongoDB), and responsive design. I have also been working on version control using Git and GitHub, as well as the basics of team development.

Additionally, I have challenged myself with game development using Godot, improving my design and implementation skills through UI design and logic development. I have a strong interest in applying technology across a wide range of fields, not limited to web development.

In the long term, I aim to continue improving my skills and become an engineer who can contribute to stable development as part of a team. I was particularly attracted to your company's environment, where there are opportunities for growth and the ability to enhance technical skills through practical work, which is why I decided to apply.

Personal Requests Section

Desired position: IT Engineer (Full Stack Developer / Web Engineer / Backend & Frontend-related)

I will follow your company's regulations regarding work location, salary, and other conditions.
